

FSD Laboratory 02

Name - Shounak Dighe

Roll No - 20

Pannel - H

Prn - 1032233107

Aim: Design and develop a responsive web page using Bootstrap front end framework.

Objectives:

1. To understand HTML tags
2. To learn the styling of web pages using CSS
3. To learn Bootstrap Front End Framework.

Theory

1. Bootstrap Grid System

The Bootstrap Grid System is a powerful tool for creating flexible and responsive web layouts. It is based on a 12-column layout, which helps designers and developers to structure their content in a way that adapts to various screen sizes.

Here's a quick overview of how it works:

- **Columns and Rows:** The grid system uses a series of rows and columns to layout and align content. Rows are wrappers for columns, and columns are the building blocks of the layout.
- **Breakpoints:** Bootstrap's grid system is responsive, meaning it changes based on the screen size or viewport width. Bootstrap provides several breakpoints (such as **xs**, **sm**, **md**, **lg**, **xl**, and **xxl**) to target different device sizes.
- **Classes:** You use classes like **.col**, **.col-md-6**, **.col-lg-4**, etc., to define how many columns an element should span at different breakpoints. For instance, **.col-md-6** will make an element span 6 columns in medium-sized viewports.

2. Bootstrap .container and .container-fluid Class

- **.container:** This class provides a fixed-width container that changes size depending on the viewport. It centers your content and provides responsive padding. For example, a **.container** element will have different maximum widths for different breakpoints (e.g., 540px, 720px, 960px, etc.).
- **.container-fluid:** Unlike **.container**, **.container-fluid** extends the full width of the viewport. It provides a fluid container that adapts to the width of the screen, with 15px padding on either side by default.

FAQ

1. What is a responsive website?

A responsive website is designed to work well on a variety of devices and screen sizes. This approach ensures that a website's layout adjusts dynamically to provide an optimal viewing experience, whether it's on a desktop, tablet, or smartphone. Responsive design often involves flexible grids, fluid images, and media queries to achieve this adaptability.

2. How Bootstrap helps to design a responsive website?

Bootstrap simplifies the process of creating a responsive website by providing:

- **Grid System:** The 12-column grid system allows developers to create layouts that adjust according to the screen size.
- **Predefined Classes:** Bootstrap includes various classes for responsive design (e.g., `.d-none`, `.d-sm-block`) and utilities for visibility, spacing, and alignment.
- **Media Queries:** Bootstrap's responsive utilities make it easy to apply different styles at different breakpoints, ensuring that your design looks good on all devices.
- **Components:** Bootstrap offers responsive components (like navbars, modals, and carousels) that adapt to screen sizes and orientations.

Problem Statement:

Design and develop a responsive web page (For example student registration, course enrollment, library management system, online shopping system etc.) using Bootstrap front end framework. Web pages should contain HTML5 elements (Use all possible formatting for example font, colour etc.).

Web page should include various

- images,
- links within the page,
- tables
- lists
- form elements
- paragraphs
- links to other pages for navigation,
- new tabs.

Use Cascaded Style Sheets (CSS) to style the web pages designed. Make use of

- Three types of styles (Inline, Internal and External)
- border,
- margins,
- padding,
- navigation,
- dropdown list
- tag selector
- class selector
- id selector
- exploring background image and position property etc.
